Design Principles

Design Principles

The Boardwise interface is guided by five principles. Every screen and component decision should be traceable to at least one of them.

1 Consistency

The same action looks and behaves the same way everywhere. Colours, typography, spacing, and component behaviour are defined once in the global design tokens (theme.css) and reused — never re-invented per page. A primary button on the Marketplace is identical to a primary button in The Vault.

2 Simplicity

Each screen has one clear primary action. Secondary options are present but visually subordinate. The interface favours progressive disclosure — complex flows such as creating a listing or uploading a rulebook are broken into focused steps rather than a single dense form.

3 Responsiveness

The platform is mobile-first, in line with the client's mandate. Layouts reflow gracefully from a single-column mobile view (with a bottom navigation bar) to a multi-column desktop view (with a side navigation bar). Components scale fluidly across the mobile, tablet, and desktop breakpoints.

4 Accessibility

The interface is usable by everyone, including users relying on screen readers or keyboard navigation. Accessibility is a baseline requirement, not an enhancement

5 Clarity & Feedback

The system always communicates its state. Loading skeletons appear during data fetches, success and error states are explicit, and complex interactions carry contextual tooltips (e.g. uploading to The Vault, setting up a P2P rental). Users are never left guessing whether an action succeeded.

Iconography

UI Component Styling

All components draw their values from the global design tokens. The standard styles below ensure uniform implementation across every feature module.

1 Buttons

Variant	Usage	Background	Text	Border
Primary	The main action on a screen (Add, Save, Confirm)	Maroon #6D0037	White	None
Secondary	Supporting actions (Filters, Cancel)	Transparent	Maroon	#C9C3D0
Accent	High-urgency calls to action	Coral #E4572E	White	None

- adding: 12px 20px · Radius: 10px · Font: Hammersmith One.
- Hover darkens the fill (maroon → #4F0028); active state nudges down 1px.
- Focus shows a 3px violet focus ring (#A78BFA) — never remove focus outlines.
- Disabled buttons drop to 50% opacity with a not-allowed cursor.

2 Cards

- Used for game listings, rulebook entries, and event cards.
 - Background white, 1px border #E5E1E8, radius 16px, subtle shadow.
 - Hover lifts the shadow from sm to md to signal interactivity.
 - Internal padding 24px; consistent cover-image → title → metadata vertical rhythm.

3 Forms & Inputs

- Full-width inputs, padding 12px 16px, radius 10px, 1px border #C9C3D0.
- Focus state: maroon border plus a soft maroon glow (0 0 0 3px rgba(109,0,55,0.15)).
- Every input has an associated, visible <label>. Placeholders are hints, never labels.
- Inline validation messages appear directly beneath the field in error red #C62828.

4 Navigation

- Desktop: persistent left side-navigation bar (248px) — Community, Marketplace, Library, Events, Profile.
- Mobile: bottom navigation bar with the same destinations as icons.
- Header height 64px, containing the logo, global search, "Ask AI", and notifications.
- The active destination is indicated with the maroon brand colour and a clear selected state.

5 Modals & Pop-ups

- Used for Add Game, Add Listing, and Upload Rulebook flows.
 - Centred overlay on a dimmed scrim; surface white with radius 16px and lg shadow.
 - A clear title, the form body, and a right-aligned Cancel / Confirm button pair.
 - Dismissible via the Cancel button, the close icon, the Esc key, and a scrim click

6 Badges & Tags

- Used for genres, categories, listing type (For Rent / For Sale), and condition.
- Pill-shaped, soft-gold background #E6C58A with navy text by default; semantic colours for status.

7 Loading & Empty States

- All data-fetching views show skeleton placeholders (not spinners) for graceful degradation on slow connections.
- Empty states carry a short message and a clear next action (e.g. "No rulebooks found — upload one").

Accessibility

Boardwise targets WCAG 2.1 Level AA conformance (NFR2.2). The following are mandatory.

1 Colour & Contrast

- Body text against its background must meet a minimum contrast ratio of 4.5:1; large text (≥ 24 px or ≥ 18 px bold) at least 3:1.
- Maroon #6D0037 on white and white text on maroon both exceed 4.5:1 and are the safe default text/background pairing.
- Colour is never the only means of conveying information — status uses an icon or label in addition to colour (e.g. listing condition, validation errors).

2 Keyboard Navigation

- Every interactive element is reachable and operable by keyboard alone, in a logical tab order.
- A visible focus indicator (the violet focus ring) is present on all focusable elements — focus outlines are never disabled.
- Modals trap focus while open and return focus to the triggering element on close. Esc closes them.

3 Screen Reader Support

- Semantic HTML first (`<button>`, `<nav>`, `<main>`, `<label>`); ARIA only to fill gaps.
- All meaningful images and game covers carry descriptive alt text; decorative images use empty alt.
- Icon-only controls (notifications, "Ask AI", close) have accessible names via aria-label.
- Live regions announce asynchronous updates (e.g. "Rulebook uploaded", real-time edit banners in The Vault).

4 Forms

- Each field is programmatically associated with its label.
- Errors are announced and described in text, not signalled by colour alone.
- Required fields are marked both visually and via aria-required.

5 Responsive & Touch

- Touch targets are at least 44 × 44px on mobile.
- The layout remains usable and reflows without horizontal scrolling down to a 320px viewport.
- Content and functionality are preserved at up to 200% zoom.

Layout and Structure

1 Grid & Layout System

Boardwise uses a 12-column responsive grid as the basis for all page layouts, centred within a `--container-max` of 1200px.

- **Gutters:** 24px (`--space-6`) between columns on desktop, 16px (`--space-4`) on mobile.
- **Outer margins:** 24px minimum on mobile, growing to centred whitespace on wide screens.
- **Breakpoints** (mobile-first — styles cascade upward):
 - RangeWidthColumnsNavigationMobile < 480px4Bottom barTablet480–1023px8Bottom bar / collapsibleDesktop ≥ 1024px12Left side bar (248px)
- **Page shell:** on desktop, a fixed 64px header plus a 248px side navigation; the main content occupies the remaining space. On mobile, the side nav collapses into the bottom navigation bar and content goes full-width.
- **Card grids** (Marketplace, Library) use CSS Grid with `repeat(auto-fill, minmax(220px, 1fr))` so cards reflow naturally without per-breakpoint rules.
- Prefer **Flexbox** for one-dimensional component layouts (toolbars, button rows) and CSS Grid for two-dimensional page and card layouts.

2 Z-index Layering Rules

- A fixed scale prevents stacking conflicts. Never invent arbitrary z-index values — use these tiers (add them to `theme.css` as `--z-*` tokens):

Layer	Token	Value	Used by
Base	--z-base	0	Default page content
Raised	--z-raised	10	Hover-lifted cards, sticky sub-headers
Navigation	--z-nav	100	Side bar, bottom bar, app header
Dropdown	--z-dropdown	200	Menus, select popovers, tooltips
Overlay	--z-overlay	1000	Modal scrim
Modal	--z-modal	1010	Modal/dialog content
Toast	--z-toast	1100	Toasts and notifications (always on top)

Rule of thumb: a higher-tier element always renders above everything in lower tiers. Toasts sit above modals so feedback is never hidden.
